

STAINLESS STEEL PLIERS SERIES - 13 / F / FT

ART. MAXI

ART. MIDI

ART. PLC

ART. PN

Description of supplemental equipment

General information

This electromechanical equipment is produced in compliance with paragraph 5.5.1 of EN 292-2 standards. The information in the Operation and Maintenance manual was compiled in accordance with paragraphs 5.5.2 and 5.5.3.

Description

The purpose of this equipment, which is used manually, is to apply electric voltage to the temples of animals (pigs, sheep, poultry) through two electrodes. This voltage is strong enough to induce a current that stuns the animal before it is slaughtered.

Stunning tongs are available in the following sizes:

MAXI for small-to-medium sized pigs

MIDI for sheep and goats

PLC for fur animals (rabbits)

PN for birds (turkeys, ostriches)

STAINLESS STEEL PLIERS SERIES - 13 / F / FT are used to apply electrodes made of a conducting material to the temples of animals.

The tongs are made of **tubular stainless steel** and are equipped with plastic grips made of an insulating material. The grips are equipped with a **dead man's button** (type 1: without logic which checks for simultaneous pressing) with silver contacts mounted on phosphor bronze springs.

The electrical connections pass internally through the arms of the tongs. An indicator light which is clearly visible to the operator and which is located on the grip shows that current is traveling between the electrodes when the button is pushed.

The electrodes are made of stainless steel and are mounted on sturdy clasps made of an insulating material. The stunning tongs are connected to the electrical panel with a 5-meter cable equipped with a **3-way** connector.

A **large eyelet** is supplied to enable the user to hang the tongs at working height. A plastic **hand guard** is supplied.

This equipment is designed for manual use, only.
