

## BATTERY-POWERED STIMULATORS

**ART. R-101-P**

**ART. PVC**

**ART. COLOR**

### Description of working set

The R 101/P - PVC - COLOR is a highly functional, efficient, practical apparatus for moving large animals quickly.

Its most important features are:

- The most advanced design and production technologies currently available.
- Exceptionally efficient, safe and practical to operate.
- Safety guaranteed by compliance with CEI regulations during the production of each and every component.
- Maximum operator safety

The R 101/P - PVC - COLOR is a **practical, safe, effective device** that is easy to handle because of its ergonomic shape, both rectangular and tubular.

Both prods, which are battery operated, are built with the finest components and made of impact-resistant material with a high insulating capacity.

A special **buzz** sound during electrical discharge results in the desired effect - even at a distance.

The unit is **very simple to use**. To operate, simply push the only button on the side of the device.

The unit is equipped with a **dead man's button**. The unit generates the electrical discharge only when the button is pushed and held down.

The **case** is made of non-conducting plastic. The plastic insulates against leakage of output voltage even in the area around the electrodes.

The R101/P is **powered by** 3 type LR6 batteries and 3 type LR14 batteries for T202/A-P, so the input circuit is entirely free from danger of electric shock.

The **output voltage** depends on a number of environmental factors and on the charge level of the batteries. In any case, the output voltage is very high, so the device must be operated only by persons with expert training in handling animals.

The **electrodes** (that is, the tips of the prods) must be placed on the animal to obtain movement.
